## Abstract

The development of unconventional oil and gas resources is becoming increasingly important as conventional reserves start to decline. In order to make the recovery of unconventional resources from low permeability reservoirs economically viable, the process of hydraulic fracturing is critical. At present, only engineering measures are implemented in the design phase to enhance the stimulation process as there is very little understanding of how the geometry and properties of pre-existing natural fractures influences hydraulic fracturing.

This study analyses the effect of the in-situ stress regime and pre-existing natural fracture intensity, orientation, hydraulic parameters and stimulation treatment design parameters on fracture stimulation and fluid flow dimensions.

Wellbore image logs from 6 wells in the Otway Basin were used for the analysis of fracture orientation, intensity and size distribution. This was used to generate a model of the natural fracture network for simulation and evaluation of pressure transient testing and fracture stimulation.

Discrete fracture network modelling is an effective approach for evaluating hydraulic fracturing and fluid flow dimensions in naturally fractured reservoirs. It was found that hydraulic fractures do not necessarily propagate as a symmetrical bi-wing fracture exactly parallel to the direction of maximum principal stress. Propagation occurs in the direction of maximum principal stress, in a complex manner, involving initiation, connectivity and reactivation of the fractures. The microseismic-event density, percolation zone size and stimulated reservoir volume, as a result of fracture stimulation is directly correlated to pre-existing natural fracture intensity, fracture compressibility and stimulation pump rate, pump pressure and slurry density. Pressure derivatives show very different characteristics and therefore fluid flow dimensions with different fracture intensity and fracture orientation.

## Table of Contents

Abstract .....	2
Table of Contents.....	3
List of Figures.....	5
List of Tables.....	11
Acknowledgments.....	14
1 Introduction.....	15
1.1 Rational.....	15
1.2 Aim and Objectives.....	18
1.3 Data and Software.....	19
2 Tectonic and Geological Setting of the Otway Basin.....	20
2.1 Geology and Structural Evolution.....	20
2.2 Stratigraphy.....	23
2.3 Play Types.....	25
3 Discrete Fracture Network Modelling.....	27
3.1 Geological Considerations.....	27
4 Methodology and Theory.....	29
4.1 Building the Discrete Fracture Network Model.....	29
4.1.1 Fracture Location.....	29
4.1.2 Spatial Analysis of Fractures.....	30
4.1.3 Fracture Orientation Analysis.....	32
4.1.4 Fracture Intensity Analysis.....	34
4.1.5 Fracture Size Distribution Analysis.....	37
4.1.6 Defining the Model Region.....	40
4.2 Well Test Simulation.....	42
4.3 Hydraulic Fracturing Simulation.....	48
4.3.1 Defining the In-situ Stress.....	49
4.3.2 Critical Stress Analysis.....	51
4.3.3 Setting up the Hydraulic Fracturing Definitions.....	51
5 Results.....	56
5.1 Image Log Analysis.....	56

5.1.1	Spatial Analysis of Fractures.....	56
5.1.2	Fracture Orientation Analysis .....	57
5.1.3	Fracture Intensity Analysis.....	64
5.1.4	Fracture Size Distribution.....	68
5.2	Well Test Simulation.....	69
5.2.1	Geometric and Hydraulic Parameter Analysis.....	69
5.3	Fracture Stimulation.....	82
5.3.1	Geometric and Hydraulic Parameter Analysis.....	83
5.3.2	Stimulation Design Parameter Analysis .....	89
6	Discussion.....	95
6.1	Image Log Analysis.....	95
