DROUGHT RESISTING PASTURES

Work Of Scientists At Waite Institute

Pastures which would be able to overcome the disabilities of an intense supply of phoniborus and nitrogen has been apply to the sent apply the phoniborus of the past apply the phoniborus and the phoniborus apply the pho

ing of the section for agriculture and forestry.

The Danthonia pastures associated with areas of open woodland, said Mr. Rumble, had received much investigation. It had been found that these pastures made very little use of the spring rainfail, but were greatly dependent on the rainfail in the autumn.

Seeded pastures of rye grass, phalaris tubercea, lucern and subterranean clover were capable, however, of using converse and subterranean converse and subterranean converse conditions of the converse condition of the converse converse conditions of the converse converse

ERADICATION OF TUBERCULOSIS

Pensions And Compulsory Examinations

DR. A. R. SOUTHWARD'S PROPOSALS

A plan by which, within 50 years, he thought tuberculosis could be stamped out in Australia, was outlined by Dr. A. R. Southwood, chairman of the Central Board of Health, in an address to the medical section of the Science Congress in Melbourne. involved, he said, legislative action to make the disease notifiable in all stages, adequate pensions to all patients, power to remove cases to hospital, and compulsory examination of all members of the community.

all members of the community.

Tuberculosis was the most serious of the infectious diseases confronting civilised communities today, said Dr. Southwood. Its widespread incidence, the serious diseases to attack and a serious control of the serious diseases to attack and easterny council and a serious made it a problem of the utmost insurance for the serious control of the serious control Tuberculosis was the most serious
