This thesis is submitted for the degree of
Doctor of Philosophy

July 2017

I would like to dedicate this thesis to my beloved family, teachers, and mentors who have helped me to become the person I am today.

Declaration

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint -award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968. I acknowledge that copyright of published works contained within this thesis resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time

Acknowledgements

This thesis is a result of many experiences which I have encountered at The University of Adelaide and it would not have been possible without the support of several people.

I want to thank Professor Katrina Falkner for her useful comments and guidance provided for this thesis, and for her valuable support, encouragement and strength provided throughout my PhD.

I want to thank Dr Damith Ranasighe for giving me the valuable opportunity to conduct further studies at the University of Adelaide, and for the guidance and valuable feedback provided throughout the PhD.

I want to thank Professor Anne Wilson for the guidance provided throughout the qualitative descriptive study which is a significant part of this thesis, for the valuable feedback provided on the thesis, and for her extraordinary support and motivation which helped me to move forward and achieve my goals.

I want to thank the managers and officers at Southern Cross Care (SA & NT) Inc, ECH Inc, ACH Group and Resthaven Inc, for their significant support provided for the research. Especially, I appreciate their assistance in releasing their staff, despite the extremely tight schedules, to attend the group meetings. I also want to thank all the home support workers and care coordinators who participated in the focus groups and all the participants who participated in the technology development studies.

I want to thank Professor Renuka Visvanathan for the feedback and advices provided, and for her assistance in collaborating with aged-care organisations.

I also would like to thank Professor Ali Babar and Dr Neha Mahajan for their support provided during the first year of my PhD journey.

I recognise that this research would not have been possible without financial support from The Hospital Research Foundation (THRF), the Government of South Australia (CPP39) and the School of Computer Science.

I would like to thank the School of Computer Science for providing me with an excellent working environment with all the resources needed to carry out my PhD.

I am thankful to Alison-Jane Hunter for her professional support in editing this thesis.

I also would like to thank my close friends in Adelaide for all their kind support, love and care provided throughout this PhD journey.

Last, but not least I would like to thank my beloved husband, parents and parents in-law for standing beside me, and for providing support and encouragement throughout the ups and downs of this journey.

Abstract

Dementia compromises older people's ability to maintain good nutrition, which in turn hinders their capacity to live in their homes for longer. Thus, they need significant support to maintain their nutritional health, often through care workers, especially when living with limited or no family support. However, with the rapid growth of the older population, the burden on care workers continues to increase, resulting in an urgent need to consider ways to assist people with dementia to maintain their nutritional health as well as their care workers to provide better support for their clients. Through a cross-disciplinary study, this thesis investigates how technologies can be used to promote nutritional health in older people with dementia living in their own homes. This involves an in-depth qualitative descriptive study and two technology development demonstrations.

Understanding needs prior to technology development is crucial for technologies to be effective, accepted by users and able to reach their desired maturity; however, this necessitates greater research investment. This thesis presents, for the first time to the best of the researcher's knowledge, a qualitative descriptive study with the aim of obtaining an holistic perspective of needs for technologies promoting nutritional health in older people with dementia living in their own home, involving focus groups with 27 care workers who provide care to older people with dementia, recruited from four leading aged care providers. Eight categories emerged from synthesising the care workers' voices. These categories provide deep, reliable insights useful for designing nutritional health-promoting technologies. In particular, nutritional health challenges faced by older people with dementia and challenges faced by care workers when providing nutritional health assistance to their clients demonstrate the demand and need for technological assistance and opportunities for developing technologies to promote nutritional health for the target cohort. Furthermore, this thesis proposes important elements need to be considered in technology development in the form of eleven technology design considerations.

Based on the formulated design considerations, two technology development demonstrations are presented. Firstly, poor fluid intake is identified as a significant problem and therefore, recognising fluid intake related primitive human motions using

batteryless Radio Frequency Identification (RFID) technology is investigated. To this end, a *smart cup* to collect fluid intake data is designed and experiments are conducted with young (30.7 ± 1.6 years) and old (69.0 ± 4.6 years) participants. The promising results demonstrate the feasibility and efficacy of recognising short distance, short duration natural fluid intake gestures using batteryless RFID technology for the first time to the best of researcher's knowledge. Secondly, a study that focuses on an architecture, Home of Things for Ambient Assisted Living—HoTAAL, suitable for facilitating the development of a collaborative environment, having heterogeneous technologies that can have seamless integration with each other as well as humans is conducted. It is expected that such an infrastructure would allow the development of a broad range of innovative technological applications to promote the nutritional health of older people with dementia. A demonstration of providing meal preparation assistance employing HoTAAL with three kitchen appliances was conducted. Additionally, possible technological applications based on HoTAAL architecture are described for several scenarios extracted from the focus group findings.
