

**CHANGES RESULTING FROM BEGG ORTHODONTIC
TREATMENT WITH EMPHASIS ON THE SOFT TISSUE PROFILE**

**VOLUME 2
APPENDICES**

A report submitted in partial fulfilment for
the degree of Master of Dental Surgery.

by

STEVEN FARRER, B.D.S.

Department of Dentistry,
Faculty of Dentistry,
The University of Adelaide,
South Australia.

1984

Awarded 26-8-85

TABLE OF CONTENTS
VOLUME 2 : APPENDICES

	Page	
SECTION 1	LITERATURE SUMMARIES AND METHOD	1
Appendix 1	Ratios reported in the literature for hard tissue : soft tissue retractions	2
Appendix 2	Correlation coefficients (<i>r</i> values) reported in the literature	3
Appendix 3	Soft tissue changes due to orthodontic treatment : a summary of the literature	5
Appendix 4	Landmarks and order of digitizing Figure a. Landmarks and order of digitizing	9 11
Appendix 5	Landmark definitions A. Hard tissue points B. Soft tissue points C. Points used for plotting purposes only	12 12 15 17
Appendix 6	Landmark location A. Hard tissue points B. Soft tissue points C. Points used for plotting purposes only	18 18 20 22
Appendix 7	Superimposition technique	23
Appendix 8	Variable descriptions A. Linear variables (i) Horizontal (ii) Vertical B. Angular variables	25 25 25 27 29
SECTION 2.	TABLES OF STATISTICAL ANALYSIS	31
Appendix 9	Ages of samples	32
Appendix 10	Analysis of errors (original vs. retraced) by 40 sets of double determinations A. Horizontal soft tissue variables B. Horizontal hard tissue variables C. Vertical soft tissue variables D. Vertical hard tissue variables E. Dentoskeletal angles F. Soft tissue inclinations and contours	33 34 35 37 38 39 40
Appendix 11	Analysis of digitizing errors by 20 sets of double determinations A. Horizontal soft tissue variables B. Horizontal hard tissue variables C. Vertical soft tissue variables	41 42 43 45

	Page
Appendix 11 (continued)	
D. Vertical hard tissue variables	46
E. Dentoskeletal angles	47
F. Soft tissue inclinations and contours	48
Appendix 12 Comparison of males and females based on the differences between pre- and post-treatment variables	49
A. Horizontal soft tissue variables	50
B. Horizontal hard tissue variables	51
C. Vertical soft tissue variables	53
D. Vertical hard tissue variables	54
E. Dentoskeletal angles	55
F. Soft tissue inclinations and contours	56

APPENDIX 4

LANDMARKS AND ORDER OF DIGITIZING

(Legend to Figure a)

Order of digitizing	Name of point	Abbreviation
0	sella turcia (axis, (0,0))	S
1	x align	X
2	y align	Y
3	nasion	N
4	soft tissue nasion	NAS
5	pronasale	PN
6	subnasale	SN
7	superior labial sulcus	SLS
8	labrale superius	LS
9	inferior aspect upper lip	IUL
10	superior aspect lower lip	SLL
(9,10)	(stomion)	(STO)*
11	labrale inferius	LI
12	inferior labial sulcus	ILS
13	soft tissue pogonion	POS
14	soft tissue gnathion	GNS
15	gnathion	GN
16	pogonion	P
17	B point	B
18	lower incisor apex	RI
19	infradentale	PRI
20	lower incisor incisal edge	IEI
21	upper incisor incisal edge	IES

22	prosthion	PR
23	upper incisor apex	RS
24	A point	A
25	anterior nasal spine	ANS
26	posterior nasal spine	PNS
27	upper molar mesial contact	MS
28	lower molar mesial contact	MI
29	gonion	GO

* In cases in which the lips were closed the point stomion was digitized twice instead of recording a missing point.

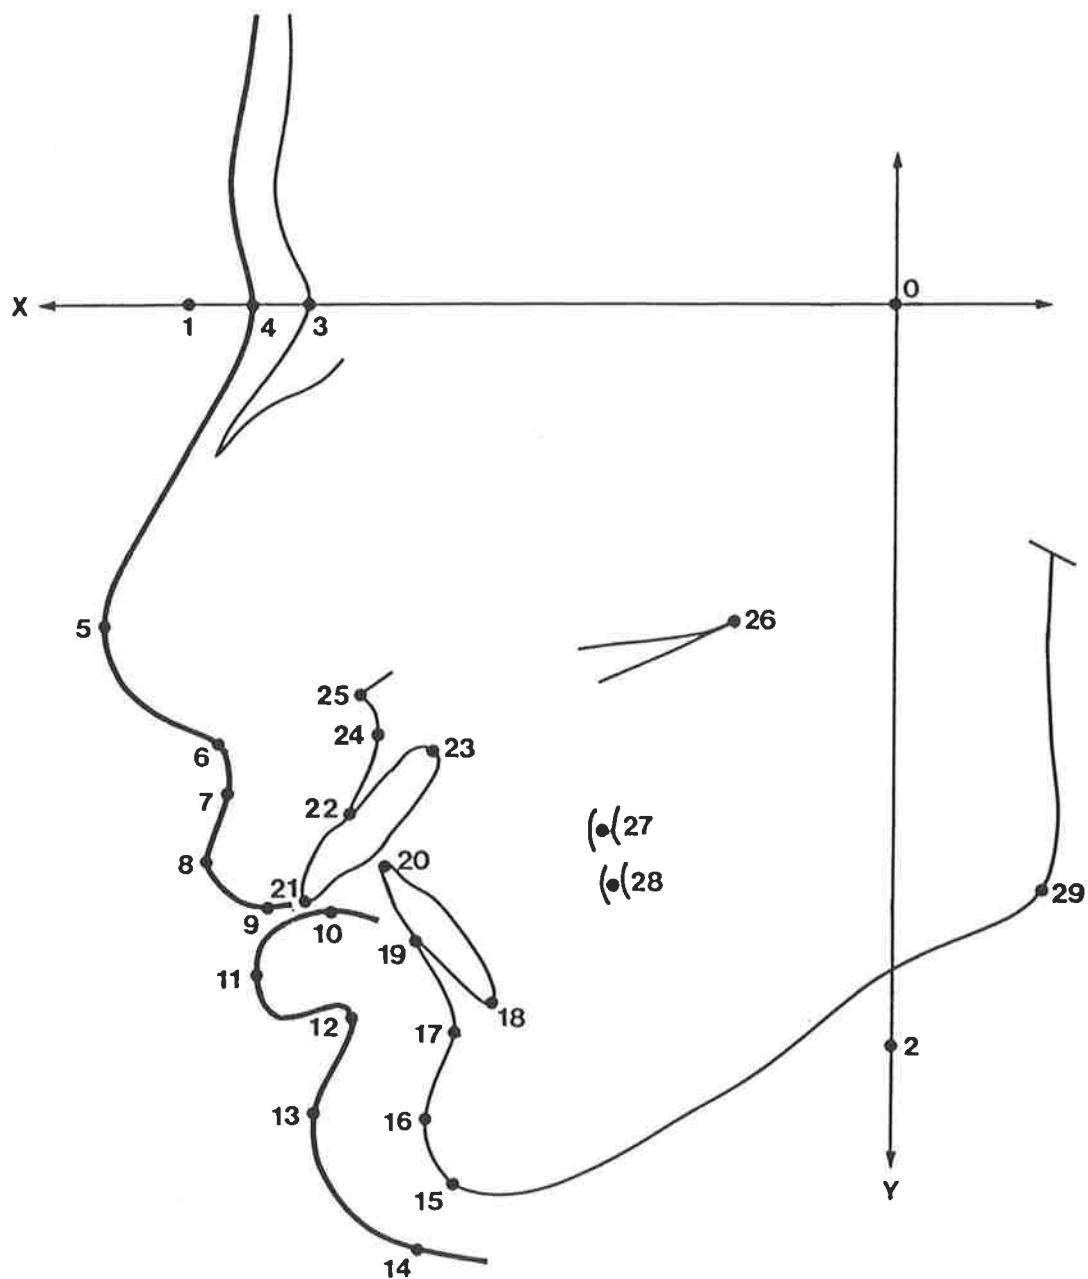

FIGURE a. Landmarks and Order of Digitizing.

APPENDIX 5

LANDMARK DEFINITIONS

A. Hard Tissue Points

The standard definitions of Riolo, Moyers et al. (1974) are provided. Where these differ significantly from those of Graber (1972), Krogman and Sassouni (1957) or Björk (1960) mention has been made; these authors have also been used to further clarify definitions.

Further clarifications are bracketed.

The points are defined in the order in which they were digitized.

The name of the point is followed by its symbol used in this study.

Alternative names are given in brackets.

1. Sella, S : The centre of the pituitary fossa of the sphenoid bone.
Determined by inspection. Björk (1960) defined the upper limit of the fossa as a line between tuberculum sellae and dorsum sellae.

2. Nasion, N : The junction of the frontonasal suture at the most posterior point on the curve at the bridge of the nose. Krogman and Sassouni (1957) discussed the variation in definition of nasion and (as did Björk 1960) provided a more precise definition: "the point nasion is really the most anterior point of the naso-frontal suture seen from norma lateralis". The definition given by Graber (1972) "the intersection of the internasal suture and the nasofrontal suture" was a craniometric definition and is indistinguishable on the head film according to Krogman and Sassouni (1957).

3. Gnathion, G N : The most anterior-inferior point on the contour of the bony chin symphysis. Determined by bisecting the angle formed by the mandibular plane and a line through pogonion and nasion. Krogman and Sassouni (1957) discussed the variation and similarity of the definitions of gnathion and menton. Their conclusion concurred with the above. Graber (1972) and Björk (1960) however defined it as the lowest point on the outline of the symphysis. The former defintion was used in this study.
4. Pogonion, P : The most anterior point on the contour of the bony chin. Determined by a tangent through nasion.
5. B point (supramentale), B : The point most posterior to a line from infradentale to pogonion on the anterior surface of the symphseal outline of the mandible.
6. Lower incisor apex, R I : The root tip of the mandibular central incisor. When the root is not yet completed, the midpoint of the growing root tip is marked. (This point is related to the central incisor with the most anterior crown position).
7. Infradentale, P R I : The anterior superior point on the mandible (alveolar process) at its labial contact with the mandibular central incisor.
8. Lower incisor edge (incision inferius), I E I : The incisal tip of the mandibular central inisor. Krogman and Sassouni (1957) defined it more specifically as relating to the most anterior central

incisor. Björk (1960) specified it as the midpoint of the incisal edge.

9. Upper incisor incisal edge (*incision inferius*), I E S : The incisal tip of the maxillary central incisor. Krogman and Sassouni (1957) defined it more specifically as relating to the most anterior central incisor. Björk (1960) specified it as the midpoint of the incisal edge.
10. Prosthion (*supradentale*), P R : The most anterior inferior point on the maxilla (alveolar process) at its labial contact with the maxillary central incisor.
11. Upper incisor apex, R S : The root tip of the maxillary central incisor. In cases where the root is not yet completed, the midpoint of the growing root tip is marked. (In relation to the central incisor with the most anterior crown position).
12. A Point (*Subspinale*), A : The most posterior point on the maxilla between the anterior nasal spine and supradentale. Graber (1972) and Krogman and Sassouni (1957) related this to a line between prosthion and anterior nasal spine.
13. Anterior nasal spine, A N S : The tip of the median, sharp bony process of the maxilla at the lower margin of the anterior nasal opening.
14. Posterior nasal spine, P N S : The most posterior point at the sagittal plane on the bony hard palate.

15. Upper molar mesial contact, M S : The mesial contact (height of contour) of the maxillary first molar relative to the functional occlusal plane.
16. Lower molar mesial contact, M I : The mesial contact (height of contour) of the mandibular first molar relative to the functional occlusal plane.
17. Gonion, G O : The midpoint of the angle of the mandible. Found by intersecting the angle formed by the mandibular plane and a plane through articulate posterior and along the portion of the mandibular ramus inferior to it.

B. Soft Tissue Points

Where possible definitions are derived from Burstone (1959).

Other sources are indicated.

Further clarifications are bracketed.

The points are defined in the order in which they were digitized.

The name of the point is followed by the symbol used in this study.

1. Soft tissue nasion, N A S : The deepest concavity between the nose and the forehead (the depth of the nasal root). (Krogman and Sassouni, 1957).
2. Pronasale, P N : The most prominent point on the contour of the nose (De Laat 1974).
3. Subnasale, S N : The point where the maxillary lip and nasal septum form a definite angle. If the depression is a gental curve,

subnasale was interpreted as the most concave point in this area as measured by a line angled 45 degrees from the nasal floor.

4. Superior labial sulcus, S L S : The deepest point on the upper lip as determined by a line drawn from subnasale inclined so that it forms a tangent with labrale superius.
5. Labrale superius, L S : The most prominent point on the upper lip as measured from a perpendicular to the nasal floor.
6. Inferior aspect upper lip, I U L : A definition of this point could not be found in the literature, although it was commonly used. It could be defined as the most inferior point on the upper lip contour with relation to a horizontal plane of reference, for example S-N.
7. Superior aspect lower lip, S L L : A definition of this point could not be found in the literature, although it was commonly used. It could be defined as the most superior point on the lower lip contour with relation to a horizontal plane of reference, for example S-N.
8. Stomion, S T O : The junction in the midline of the upper and lower lips.
9. Labrale inferius, L I : The most prominent point on the lower lip as determined by a perpendicular from nasal floor.

10. Inferior labial sulcus, I L S : The most concave point as measured by a line tangent to menton point (soft tissue) and labrale inferius.
11. Soft tissue pogonion, P O S : The most anterior point on the chin as determined from a perpendicular to nasal floor.
12. Soft tissue gnathion, G N S : A defintion of this point could not be found in the literature. De Laat (1974) used a point 2 cm. inferiorly from POS on the contour of the chin. It could be defined from the construction used in this study as the point on the chin contour at the intersection of a line through sella and gnathion.

C. Points Used For Plotting Purposes Only

These points, together with Sella (which defines the origin or (0,0)) define the x and y axes of the cartesian coordinate system.

The name is followed by the symbol used in this study.

X align, X : any point on the X axis (the pre-treatment S-N line) used to define the X axis in conjunction with Sella.

Y align, Y : any point on the Y axis (the pre-treatment S-N perpendicular through S) used to define the Y axis.

APPENDIX 6

LANDMARK LOCATION

Extremal landmarks (that is those points defined using terms as for example, most anterior, inferior) have been located in relation to the reference plane sella-nasion using tangents to the area of interest parallel to sella-nasion or sella-nasion perpendicular using a plastic protractor.

In those cases in which a parallel line failed to produce a tangent to the area of interest (due to the shape of the surface) a tangent was taken from another point. This method of location was used for both radiographs of the same subject. The points involved were: Pogonion, A point and B point (tangents to a line through nasion) and soft tissue pogonion, superior labial sulcus and inferior labial sulcus (tangents to a line through soft tissue nasion).

A. Hard Tissue Points

1. Sella, S : Selected as the geometric centre after tracing the internal anatomy of the pituitary fossa and extending the tracing superiorly to form a symmetrical ellipical shape. The definition allowed for some interpretation as the extent of the fossa was not strictly defined.
2. Nasion, N : As per the definition. The frontonasal suture was usually located in the most concave aspect of the curve of the nasal and frontal bones.

3. Gnathion, G N : Located in relation to the mandibular plane (for construction purposes taken as a tangent to the lower border of the mandible) and a tangent to pogonion through nasion. To bisect the angle between these two lines a line from sella to the junction of the lines was drawn. The point of intersection with the outer surface of the mandible was identified as gnathion.
4. Pogonion, P : The most anterior point on the bony chin in relation to a sella-nasion perpendicular.
5. B point (supramentale), B : The most posterior point located in relation to a sella-nasion perpendicular.
6. Lower incisor apex, R I : As per the definition.
7. Infradentale, P R I : As per the definition.
8. Lower incisor incisal edge (incision inferius) I E I : As per the definition.
9. Upper incisor edge (incision superius) I E S : As per the definition.
10. Prosthion (supradentale), P R : As per the definition.
11. Upper incisor apex, R S : As per the definition.
12. A point (Subspinale), A : The most posterior point in relation to a sella-nasion perpendicular.

13. Anterior nasal spine, A N S : As per the definition.
14. Posterior nasal spine, P N S : As per the definition.
15. Upper molar mesial contact, M S : The most convex aspect of the mesial crown surface of the first molars (second molars where the first molars were absent) was located; right and left images were averaged.
16. Lower molar mesial contact, M I : The most convex aspect of the mesial crown surface of the first molars (second molars where the first molars were absent) was located; the right and left images were averaged.
17. Gonion, GO: Located in relation to the mandibular plane (for construction purposes taken as a tangent to the lower border of the mandible) and a tangent to the posterior aspect of the ramus through articularare posterior. The angle between these lines was bisected and the intersection of the bisector with the inferior aspect of the mandible was identified as gonion. At all stages right and left sides were averaged.

B. Soft Tissue Points

1. Soft tissue nasion, N A S : The deepest concavity was located in relation to a sella-nasion perpendicular.
2. Pronasale, P N : The most prominent point was located in relation to a sella-nasion perpendicular.

3. Subnasale, S N : The deepest point in the curve between the upper lip and nose was found in relation to a line from pronasale to upper lip sulcus.
4. Superior labial sulcus, S L S : The deepest point on the upper lip was located in relation to a sella-nasion perpendicular.
5. Labrale superius, L S : The most prominent point on the lip was located in relation to a sella-nasion perpendicular.
6. Inferior aspect upper lip, I U L : The most inferior point was located in relation to sella-nasion.
7. Superior aspect lower lip, S L L : The most superior point was located in relation to sella-nasion.
8. Stomion, S T O : As per the definition.
9. Labrale inferius, L I : The most prominent point on the lip was located in relation to a sella-nasion perpendicular.
10. Inferior labial sulcus, I L S : The deepest point on the lower lip was located in relation to a sella-nasion perpendicular.
11. Soft tissue pogonion, P O S : The most prominent point on the chin was located in relation to a sella-nasion perpendicular.
12. Soft tissue gnathion, G N S : As per the definition (refer also to location of gnathion).

C. Points Used For Plotting Purposes Only

X align, X : Any point on the pre-treatment sella-nasion line was located. In the case of the pre-treatment radiograph nasion itself was usually used, in the post-treatment radiograph a point near nasion was used.

Y align, Y : Any point on the pre-treatment sella-nasion perpendicular line was located. The point was usually selected in the region of the lower border of the mandible.

APPENDIX 7

SUPERIMPOSITION TECHNIQUE

The technique used was that of Björk (1968) and Björk and Skieller (1983).

The procedure followed can be listed in stages:

1. A Björk transparent plastic sheet on which a thin black cross was marked was mounted on the viewing screen with tape.
2. The pre-treatment radiograph was examined and sella and nasion were identified and the points marked lightly on the film.
3. The pre-treatment radiograph was then secured with tape to the screen with sella at the centre of the cross and nasion lying on the X-axis.
4. Tracing paper was then secured to the screen with tape. Nasion, sella and Y align were transferred to the tracing paper.
5. The other points listed in figure a were then identified and marked according to the definitions and location specifications in appendices 5 and 6.
6. Relevant information was marked on the tracing paper, that is, the subjects name, age and identity number.
7. The tracing paper was removed.

8. The post-treatment radiograph was then superimposed on the pre-treatment radiograph. (For details see chapter 2.4).
9. The pre-treatment sella (intersection of the cross), a point on the X-axis near nasion (X-align) and a point on the Y-axis near the lower border of the mandible (Y-align) were then marked lightly on the post-treatment film.
10. Both films were then removed from the screen.
11. The post-treatment film was then replaced with the origin (pre-treatment sella) placed on the axis of the cross, and X-align and Y-align placed on the X and Y axes respectively and secured with tape.
12. Tracing paper was then secured with tape.
13. The points for the reference axes and landmarks were then traced. The landmarks were identified and traced according to the definitions and specifications listed in appendices 5 and 6.
14. The subjects identification was marked.
15. The radiograph was removed and the marks on both films were erased.

APPENDIX 8

VARIABLE DESCRIPTIONS

A. Linear Variables(i) Horizontal

All measurements are perpendicular to the y-axis (sella-nasion perpendicular through nasion) defined by points 0 and 2, to the landmark. The name of the variable is followed by the abbreviation used for computing purposes.

VARIABLE NUMBER	VARIABLE NAME horizontal distance to:	VARIABLE ABBREVIATION	IDENTITY OF LANDMARK
1	Soft tissue nasion	H ST NAS	4
2	Pronasale	H ST PN	5
3	Subnasale	H ST SN	6
4	Superior labial Sulcus	H ST SLS	7
5	Labrale superius	H ST LS	8
6	Inferior aspect upper lip	H ST IUL	9
7	Superior aspect lower lip	H ST SLL	10
8	Labrale inferius	H ST LI	11
9	Inferior labial sulcus	H ST ILS	12
10	Soft tissue pogonion	H ST POS	13
11	Soft tissue gnathion	H ST GNS	14

12	Nasion	H	HT	N	3
13	A point	H	HT	A	24
14	Upper incisor apex	H	HT	RS	23
15	Prosthion	H	HT	PR	22
16	Upper incisor incisal edge	H	HT	IES	21
17	Lower incisor incisal edge	H	HT	IEI	20
18	Infradentale	H	HT	PRI	19
19	Lower incisor apex	H	HT	RI	18
20	B point	H	HT	B	17
21	Pogonion	H	HT	P	16
22	Gnathion	H	HT	GN	15
23	Upper molar mesial contact	H	HT	MS	27
24	Lower molar mesial contact	H	HT	MI	28
25	Gonion	H	HT	GO	29

H = horizontal

HT = hard tissue

ST = soft tissue

(ii) Vertical

All measurements are perpendicular to the x-axis (sella-nasion) defined by points 0 and 1, to the landmark. The name of the variable is followed by the abbreviation used for computing purposes.

VARIABLE NUMBER	VARIABLE NAME	VARIABLE ABBREVIATION	IDENTITY of LANDMARK
	horizontal distance to:		measured to 0, 1:
26	Soft tissue nasion	V ST NAS	4
27	Pronasale	V ST PN	5

65	Concavity of upper lip	A SC ULIP	6 7 8	Burstone (1958)
66	Concavity of lower lip	A SC LLIP	11 12 13	Burstone (1958)

A = angular

DS = dentoskeletal variable

SI = soft tissue inclination

SC = soft tissue contour

SECTION 2

TABLES OF STATISTICAL ANALYSIS

All statistics were calculated from the total sample size of 30 males and 30 females.

	AGES AT PRE-TREATMENT RADIOGRAPHY			AGES AT POST-TREATMENT RADIOGRAPHY			DIFFERENCES			AGES OF SAMPLES
	\bar{x}	S	Range	\bar{x}	S	Range	\bar{x}	S	Range	
MALES	13.7	1.4	11.4 to 16.8 (5.4)	15.6	1.2	13.8 to 18.9 (5.2)	1.9	0.5	1.1 to 2.8 (1.7)	
n=30										
FEMALES	13.8	1.4	12.0 to 17.8 (5.8)	15.8	1.5	13.7 to 19.6 (5.9)	2.0	0.9	1.1 to 5.5 (4.4)	
n=30										

Appendix 9. Ages of the male and female samples calculated from the times of pre- and post-treatment radiography.

All differences between mean values of males and females are non-significant.

\bar{x} = mean, S = standard deviation.

APPENDIX 10

ANALYSIS OF ERRORS (ORIGINAL VS. RETRACED) BY 40 SETS OF DOUBLE DETERMINATIONS.

6 Tables, A to F

Legend

\bar{x} = Mean.
S = Standard Deviation.
M diff = Mean difference between first and second determinations.
 $E(M \text{ diff})$ = Standard error of M diff.
t = Student's t Test
 $S(\text{error})$ = Standard deviation of a single determination (Dahlberg 1940)
 $E(\text{var})\%$ = Error variance per cent.
1% level t = 2.708, for degrees of freedom = 39
5% level t = 2.023, for degrees of freedom = 39
* mean difference from zero at probability < 0.05 level.
** mean difference from zero at probability < 0.01 level.
NS = Nasion-sella reference line.
NSP = Nasion-sella perpendicular reference line.
Variable descriptions are listed in appendix 8.

APPENDIX 13

DESCRIPTIVE STATISTICS

Each heading has 6 Tables, (i) to (vi)

- A. Males pre-treatment
- B. Females pre-treatment
- C. Males post-treatment
- D. Females post-treatment
- E. Males pre- and post-treatment differences
- F. Females pre- and post-treatment differences

Legends

\bar{x}	=	mean
$E(M)$	=	standard error of the mean
S	=	standard deviation
Min	=	minimum value
Max	=	maximum value
$\sqrt{b_1}$	=	skewness
*	=	skewness significant at $p < 0.05$
**	=	skewness significant at $p < 0.01$

APPENDIX 14

RATIOS FOR INCISOR : LIP RETRACTIONS

Ratios have been calculated using post- minus pre-treatment mean values for variables 5, 8, 16 and 17 (Appendix 13E and 13F)

These ratios can be compared to previous studies (Appendix 1)

U1 = upper incisor (incisal edge, 16)

UL = upper lip (labrale superius, 5)

L1 = lower incisor (incisal edge, 17)

LL = lower lip (labrale inferius, 8)

	U1:UL	UL:LL	L1:LL
MALES	3.8:1	2.7:1	2.5:1
FEMALES	3:1	1.6:1	0.8:1

Appendix 14. Ratios for incisor : lip retractions.

APPENDIX 15

CORRELATION COEFFICIENTS

The coefficients were calculated for the differences between pre- and post-treatment variables (as in Appendix 13E and 13F).

- A. Coefficients involving horizontal soft tissue variables.
6 Tables, (i) to (vi).
- B. Coefficients involving vertical soft tissue variables.
5 Tables, (i) to (v).
- C. Coefficients involving soft tissue angular variables.
4 Tables, (i) to (iv).
- D. Coefficients involving hard tissue variables.
3 Tables, (i) to (iii).

Legend

M = males

F = females

* = coefficients significant at $p < 0.05$

** = coefficients significant at $p < 0.01$

Coefficients often reported in previous studies have been outlined in the tables.

Variable abbreviations are listed in Appendix 8.

Table 15D(iii) continued

SECTION 3

APPENDIX 16

CASE ANALYSES

5 selected cases from the sample

Each case includes:

- a case description
- superimposed tracings (method in chapter 2.4), figure (i)
- profile photographs taken before and after treatment (not standardised), figure (ii)
- graphs of Z-scores for 17 selected variables (abbreviations listed in appendix 8), figure (iii)

Pre-treatment Z-scores, dotted line

Pre-treatment/post-treatment differences Z-scores, solid line

A. CASE 1

Subject 50, female
Class 2, division I malocclusion

Age pre-treatment : 12.9 yrs (-0.6 standard deviations from \bar{x})

Age post-treatment : 14.8 yrs
Difference between post- and pre-treatment
ages -0.2 standard deviations from \bar{x}

The hand-wrist radiograph indicated that the skeletal age was approximately 12 yrs. pre-treatment (Greulich and Pyle, 1966) and according to Grave and Brown (1976) (figure 13) this corresponded to peak growth velocity.

Treatment : Non-extraction

Lip posture : Slight interlabial gap before and after treatment. Lips relaxed post-treatment.

Z-scores : All scores in figure (iii) within 2 standard deviations from the \bar{x} .
Incisor retraction very close to the \bar{x} .
(except B point).
Lower incisor proclination was close to the \bar{x} .
H ST variables were all within 1 standard deviations of \bar{x} .

Discussion : The soft tissue profile response in figure (i) shows a downward and forward growth pattern. The lips showed retraction and reduced concavities. The mandibular plane rotated downwards and backwards.

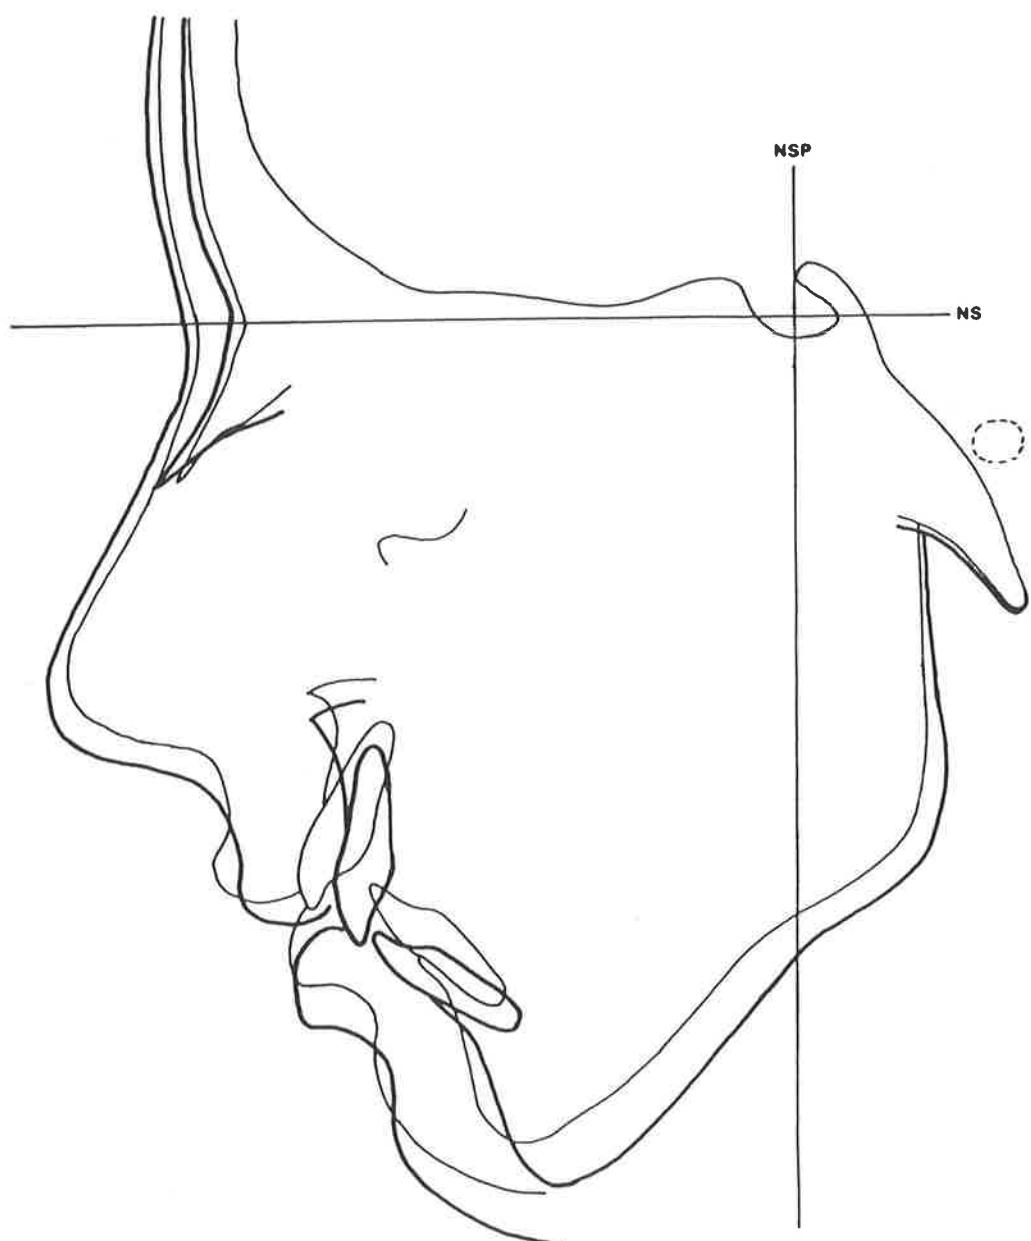

Figure b(i) Superimposed tracings of case 1

— pre-treatment

— post-treatment

Pre-treatment

Post-treatment

Figure b(ii) Profile photographs of case 1

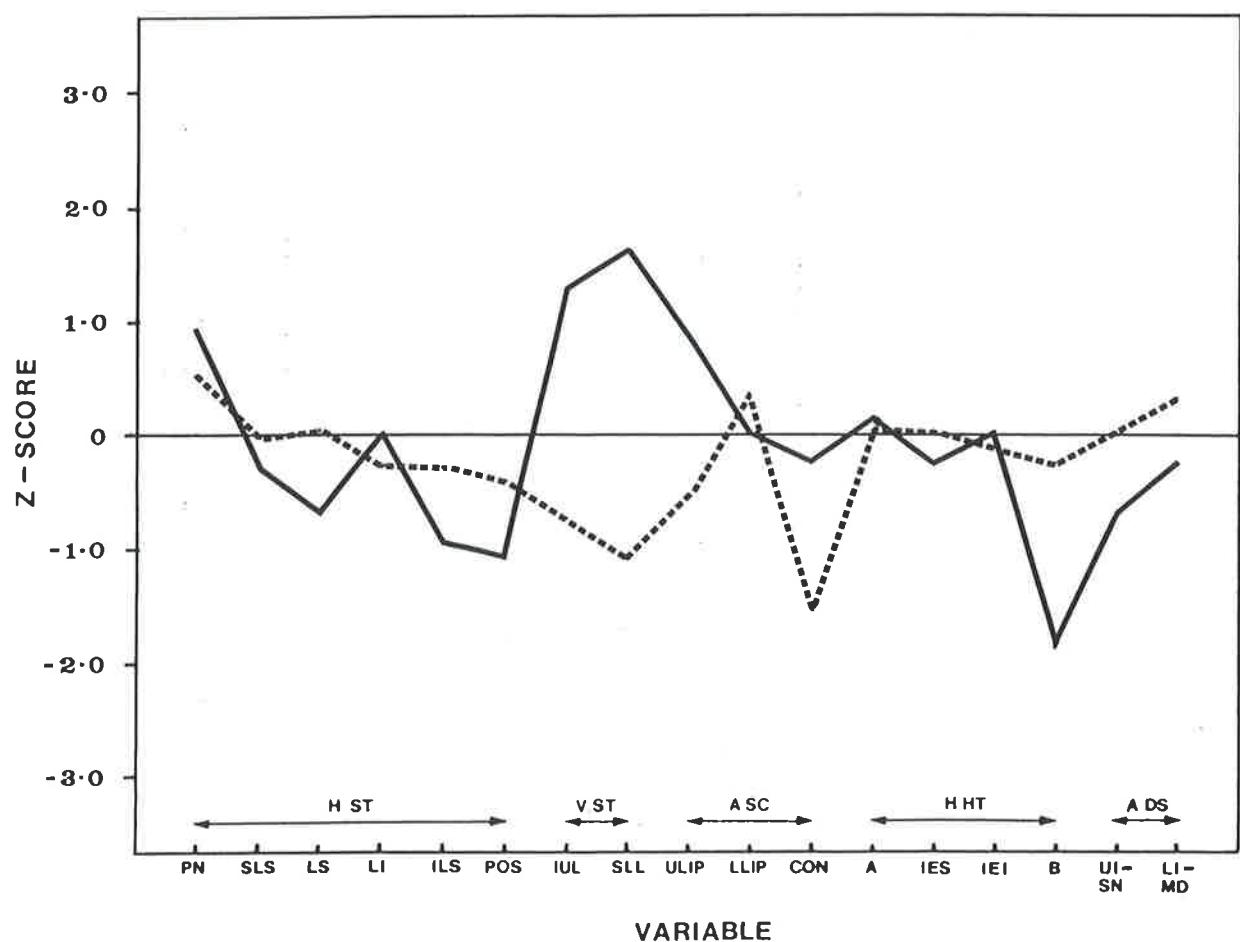

Figure b(iii) Graph of Z-scores for case 1

B. CASE 2

Subject 44, female
Class 2, division 1 malocclusion

Age pre-treatment : 13.9 yrs. (0.1 standard deviations from \bar{x})

Age post-treatment : 16.8 yrs.

Difference between post- and pre-treatment ages 1.0 standard deviation from \bar{x}

The hand-wrist radiograph indicated that the skeletal age was approximately 13.5 yrs. pre-treatment (Greulich and Pyle, 1966), and according to Grave and Brown (1976) (figure 13) this was well post-peak in relation to the adolescent growth spurt.

- Treatment : 4 | 4 and E | E extracted.
~~65 | 56~~ were congenitally absent.
~~7 | 7~~ were in the position of ~~6 | 6~~. Lingual root torque 21 | 12 and 21 | 12
- Lip posture : Slight interlabial gap pre-treatment, closed without apparent strain post-treatment.
- Z-scores : Compared to the \bar{x} values there was:
 Greater H ST and H HT values pre-treatment.
 Less incisor and lip retraction.
 More chin and nose growth.
 Less lower incisor proclination.
 Upper lip flattened less, and lower lip more.
 Profile convexity (excluding the nose) increased more.
- Discussion : The profile changes seen in figure (i) show significant forward growth of the bony chin which was followed in about a 1:1 relationship by the soft tissue chin. Significant forward nose growth also occurred. As a result the profile "dished-in" after treatment even though the lip response was less than the mean. The lower incisors were uprighted (retroclined after stage 2 and lingual root torque was applied in stage 3). Had the lower incisors been kept forward (proclined - as in many other cases and according to the mean) a better lower lip support way have been provided. However, the long term stability of the lower incisor segment may also have been compromised.

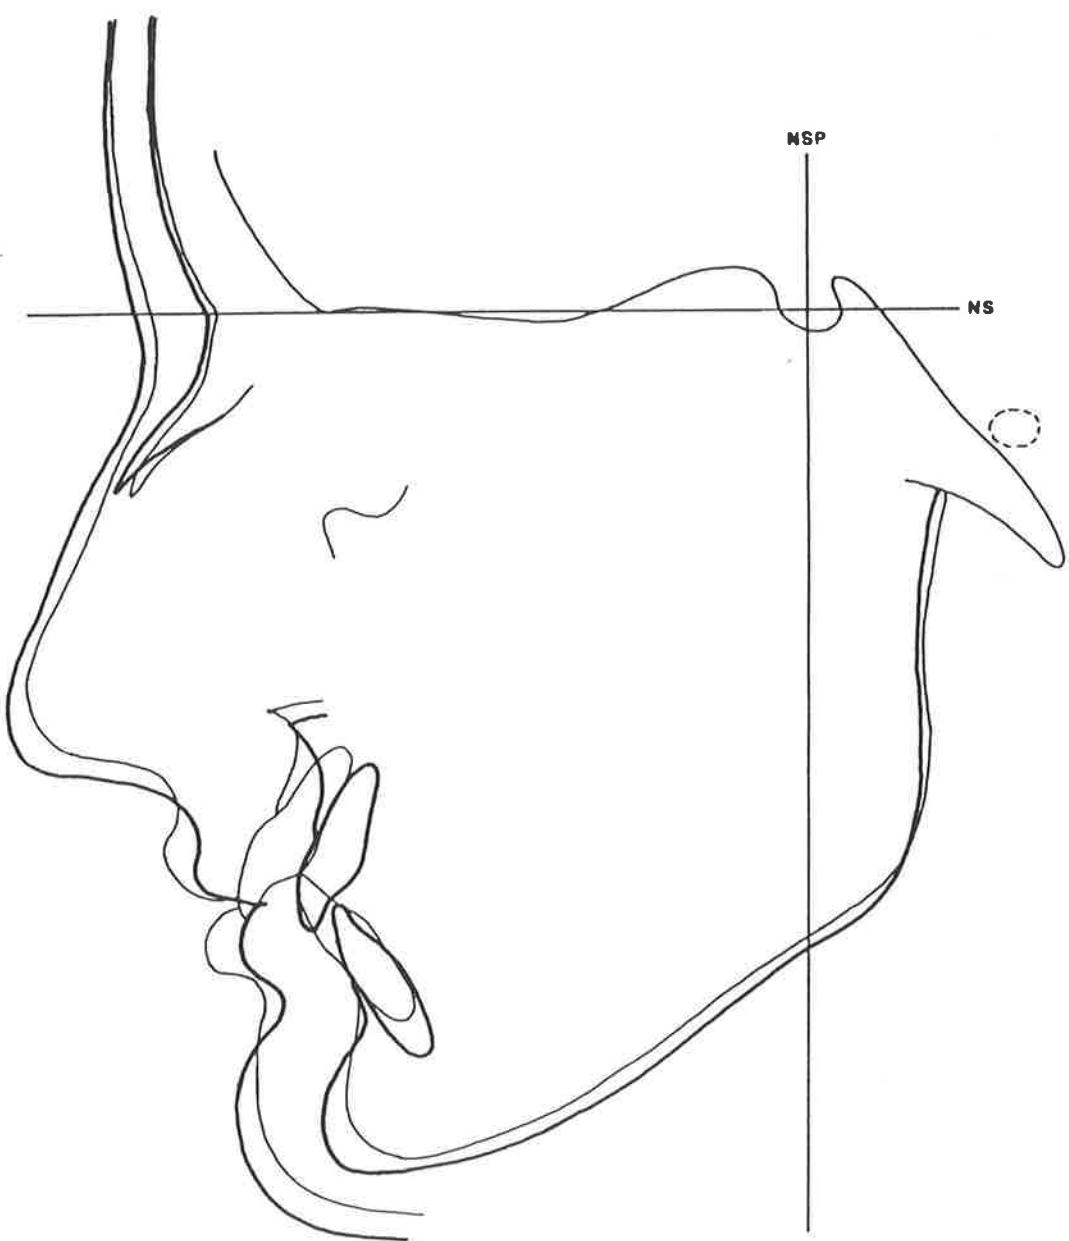

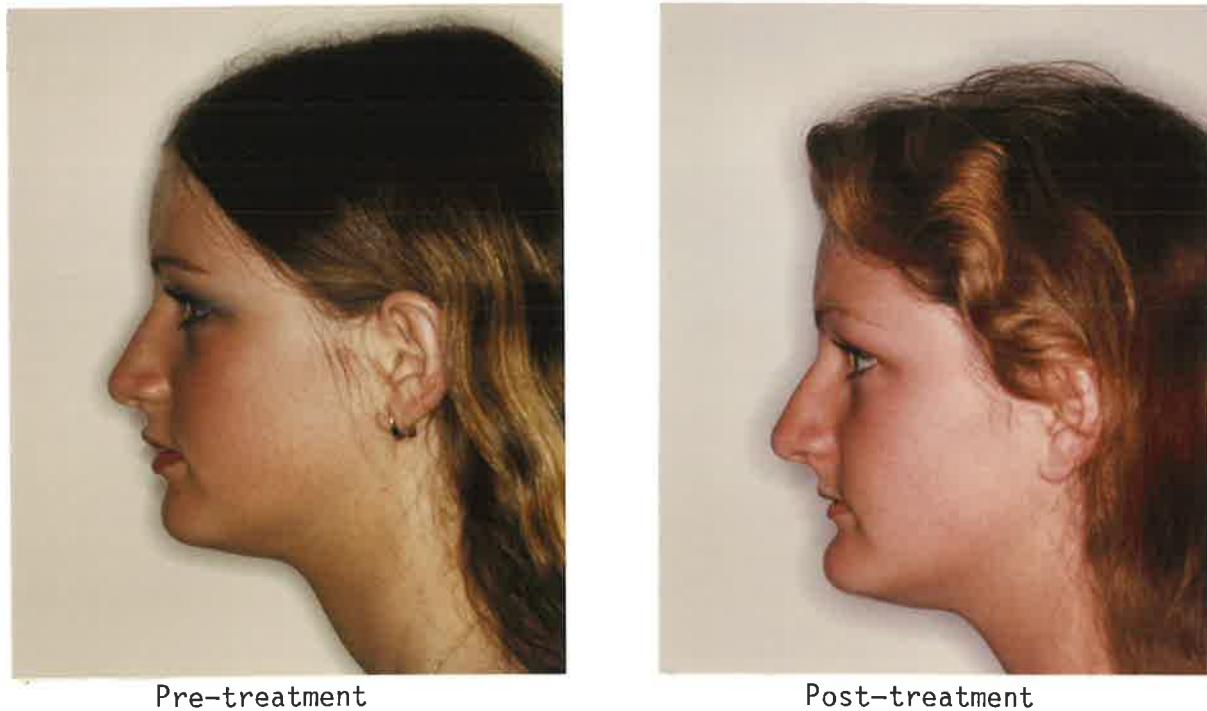

Figure c(i) Superimposed tracings of case 2

— pre-treatment

— post-treatment

Pre-treatment

Post-treatment

Figure c(ii) Profile photographs of case 2

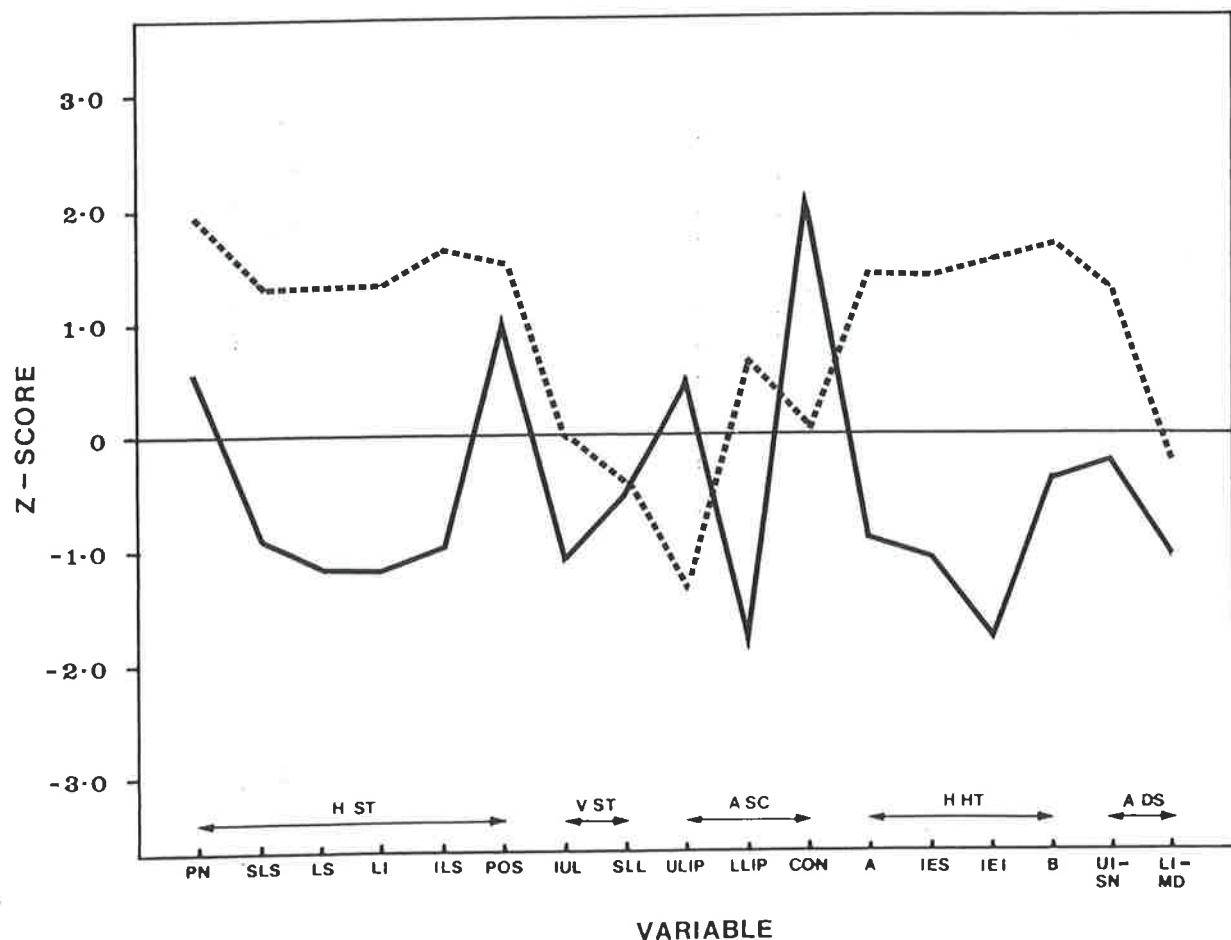

Figure c(iii) Graph of Z-scores for case 2

C. CASE 3

Subject 41, female
Class 2, division 1 malocclusion

Age pre-treatment : 15.3 yrs. (1.1 standard deviations from \bar{x})

Age post-treatment : 16.8 yrs.

Difference between post- and pre-treatment ages -0.64 standard deviations from \bar{x}

The hand-wrist radiograph indicated that the skeletal age was approximately 15.5 yrs. pre-treatment (Greulich and Pyle, 1966) and according to Grove and Brown (1976) (figure 13) very little growth potential remained.

Treatment : 6 | 4 extracted

Lip posture : Small interlabial gap pre-treatment, curled lower lip. Closed without apparent strain post-treatment.

Z-scores : Mainly close to the \bar{x} .
More retraction if IES than \bar{x} , retraction of LS close to \bar{x} .
Lower incisors more upright than \bar{x} before treatment and also proclined more due to treatment.

Discussion : Minimal nose change occurred since the patient was essentially non-growing. Mandibular rotation occurred and the soft tissue chin followed. Both lips reduced in concavity. Although the upper lip seemed to follow the upper incisor less than average, this could also largely be due to lip posture.

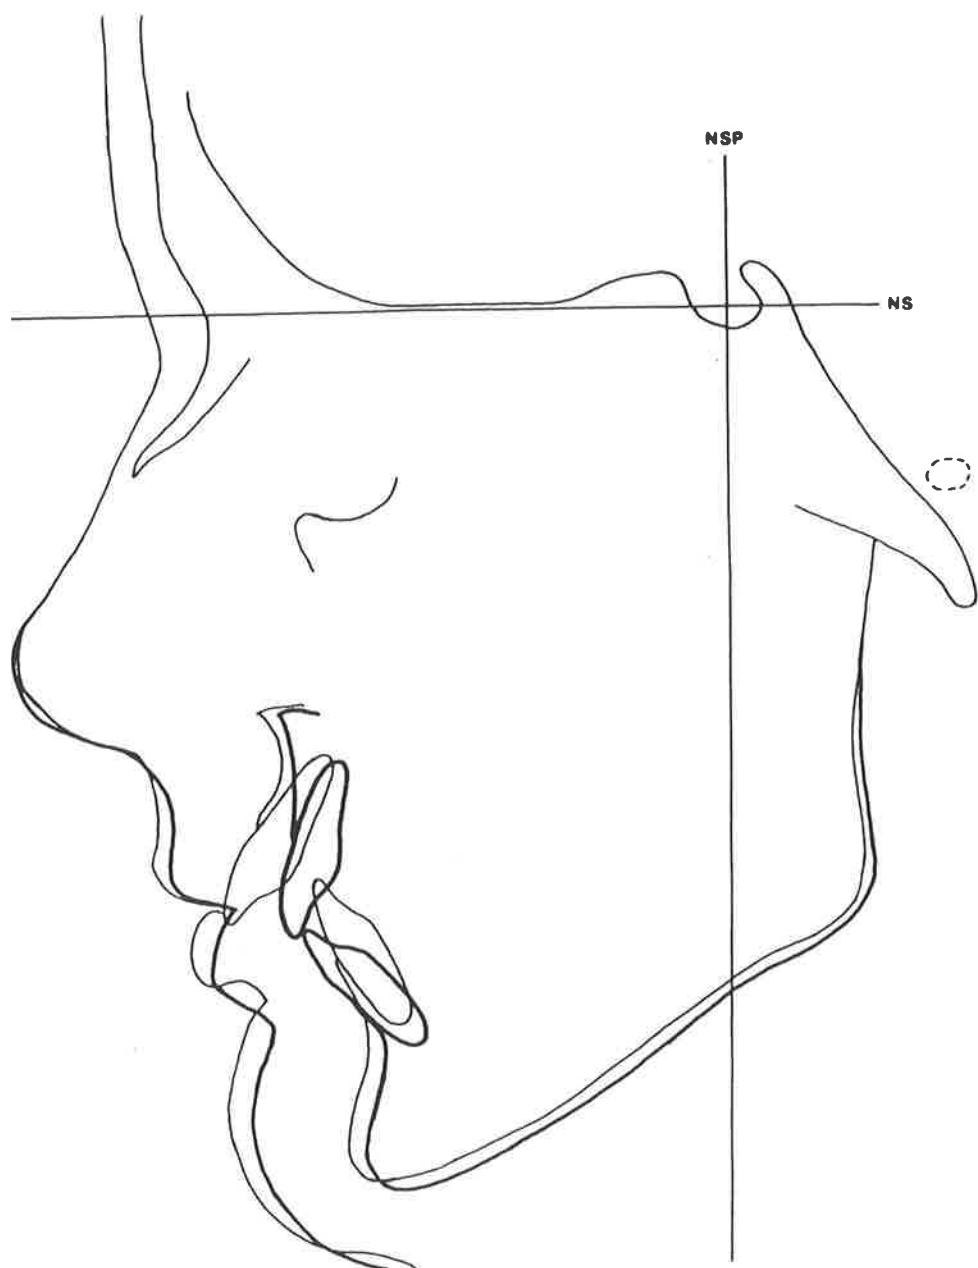

Figure d(i) Superimposed tracings of case 3

— pre-treatment
— post-treatment

Figure d(ii) Profile photographs of case 3

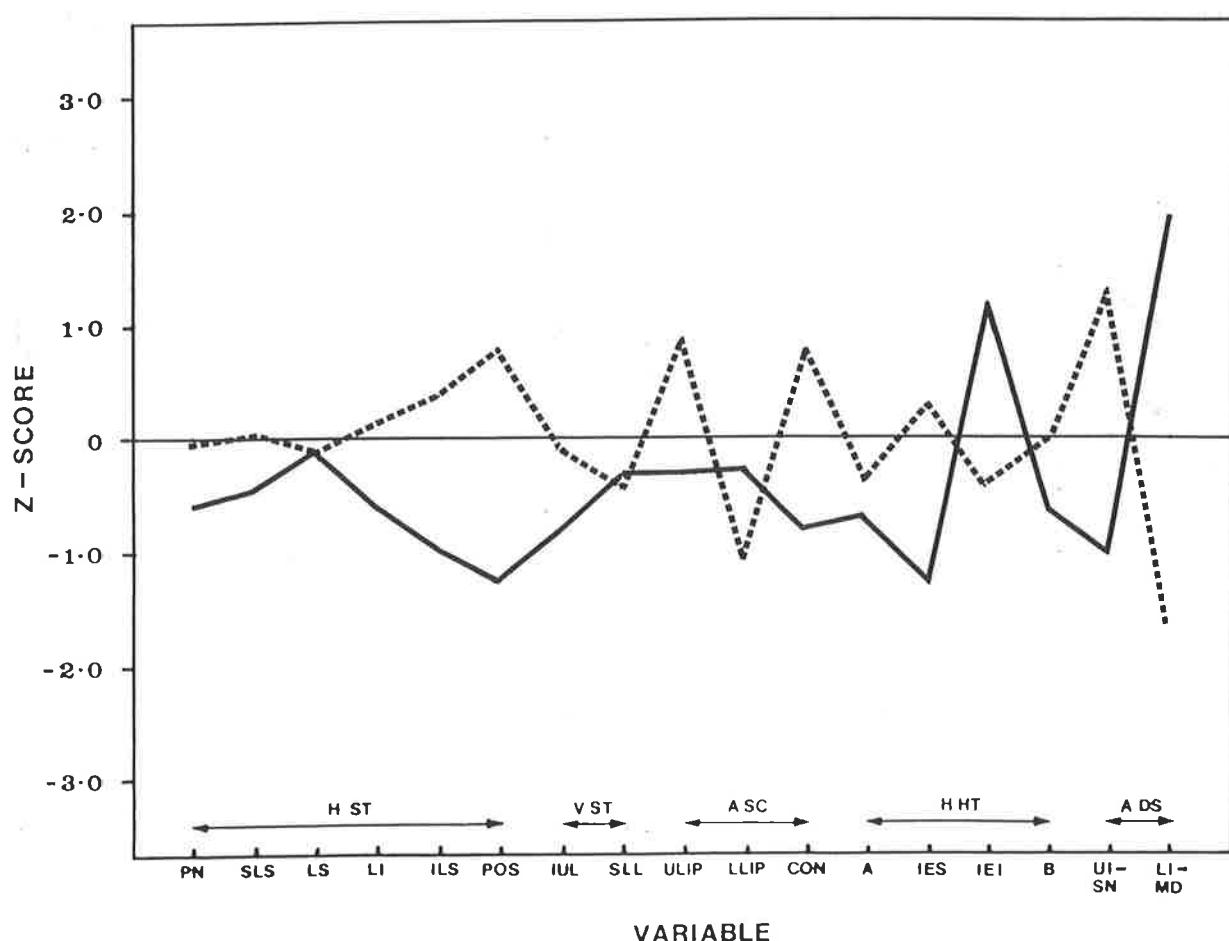

Figure d(iii) Graph of Z-scores for case 3

D. CASE 4

Subject 14, male
Class 1 molars and proclined incisors

Age pre-treatment : 12.4 yrs. (-0.9 standard deviations from \bar{x})

Age post-treatment : 14.8 yrs.

Difference between post- and pre-treatment
ages 0.9 standard deviations from \bar{x}

The hand-wrist radiograph indicated that the skeletal age was approximately 11.5 yrs. which was about 1 year less than the chronological age pre-treatment (Greulich and Pyle, 1966). According to Grave and Brown (1976) (figure 13), this was well pre-peak in relation to the adolescent growth spurt.

Treatment : Four first premolars extracted.

Lip posture : Interlabial gap, relaxed before and after treatment.

Z-scores : H ST and H HT scores close to means before treatment. H ST response greater than \bar{x} values. Flatter lower lip before treatment, less flattening after treatment.

Discussion : Significant growth occurred as evident in the large space between the soft tissue profiles in figure (i). The chin grew downwards and forwards. The large fleshy lips tended not to follow the incisor retraction and they showed a net forward movement post-treatment.

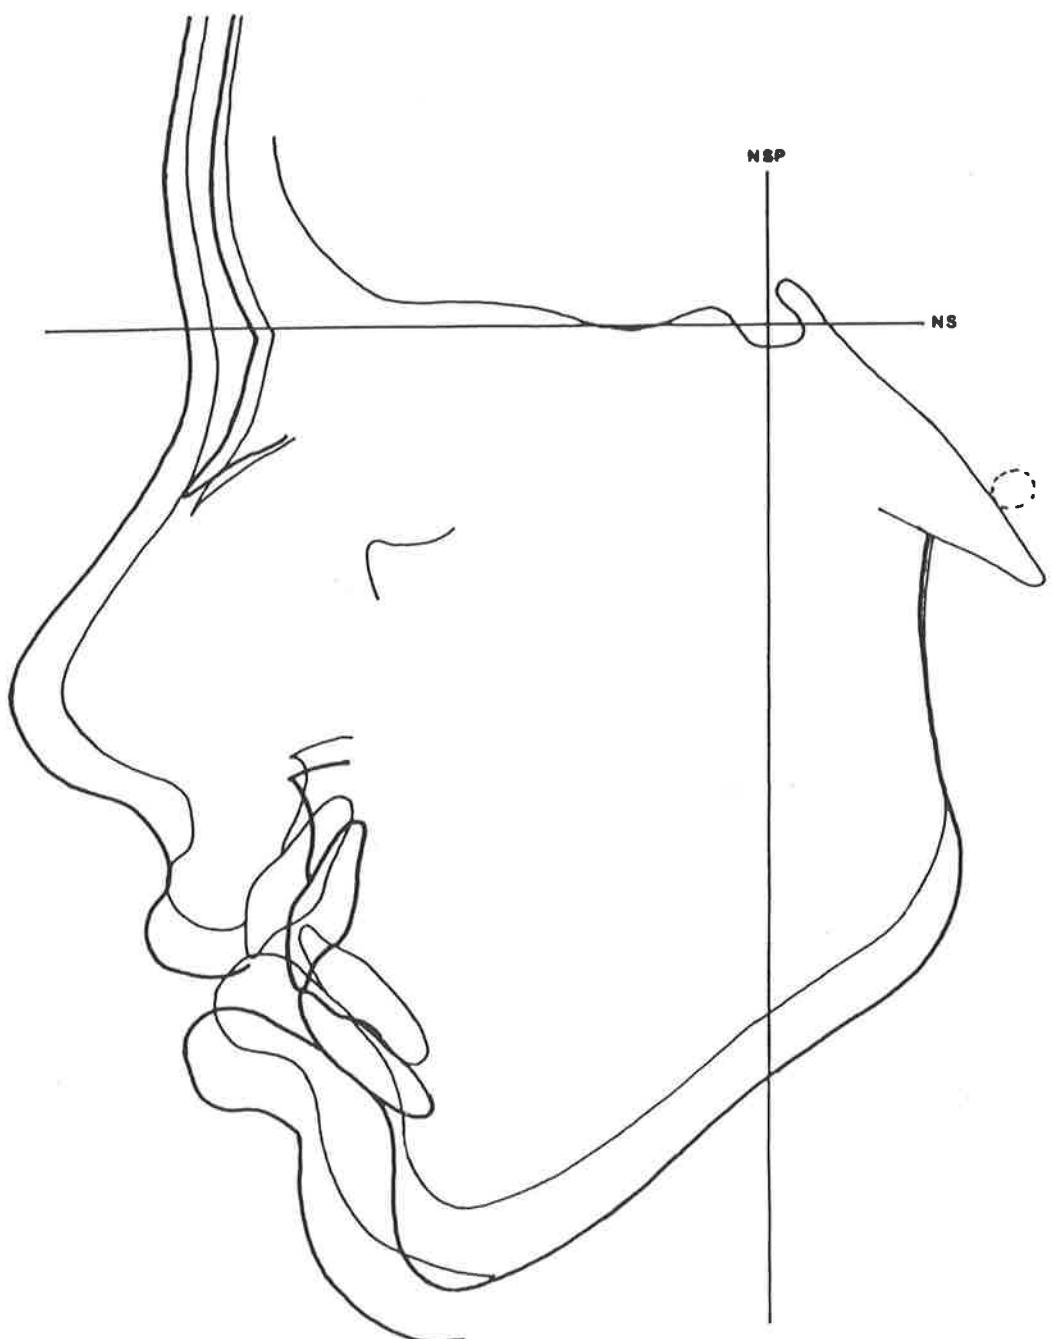

Figure e(i) Superimposed tracings of case 4

— pre-treatment

— post-treatment

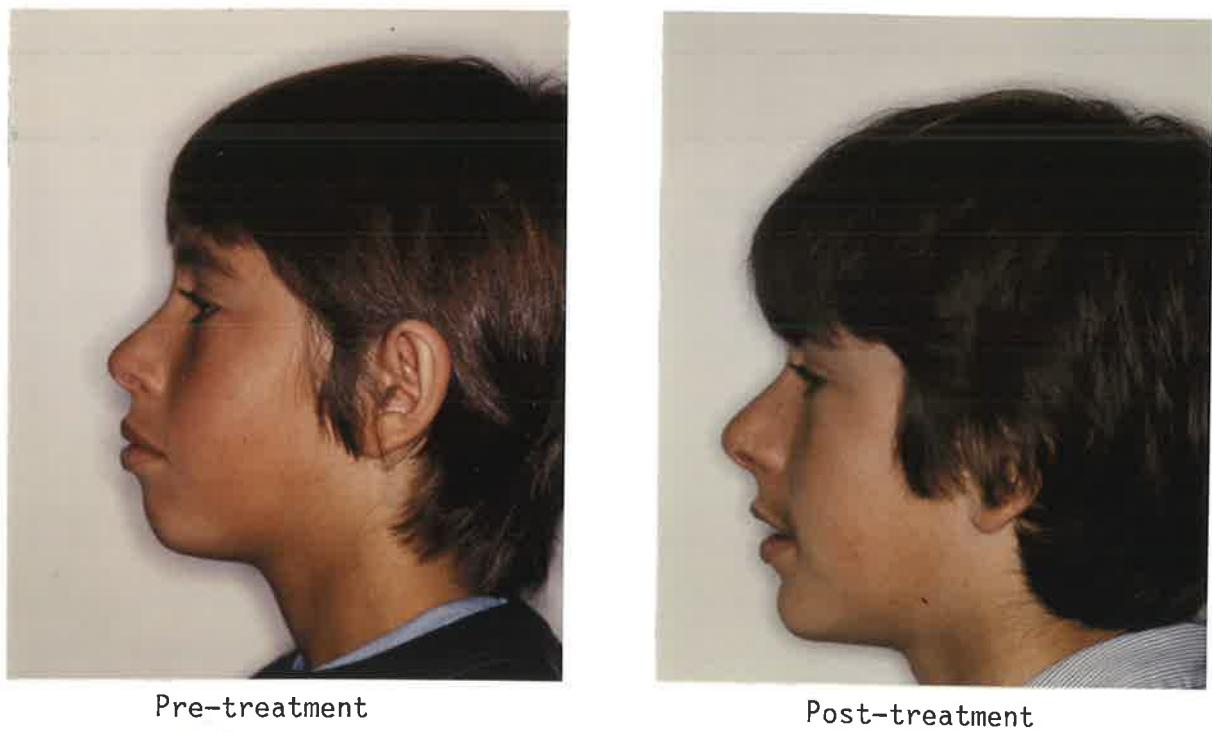

Figure e(ii) Profile photographs of case 4

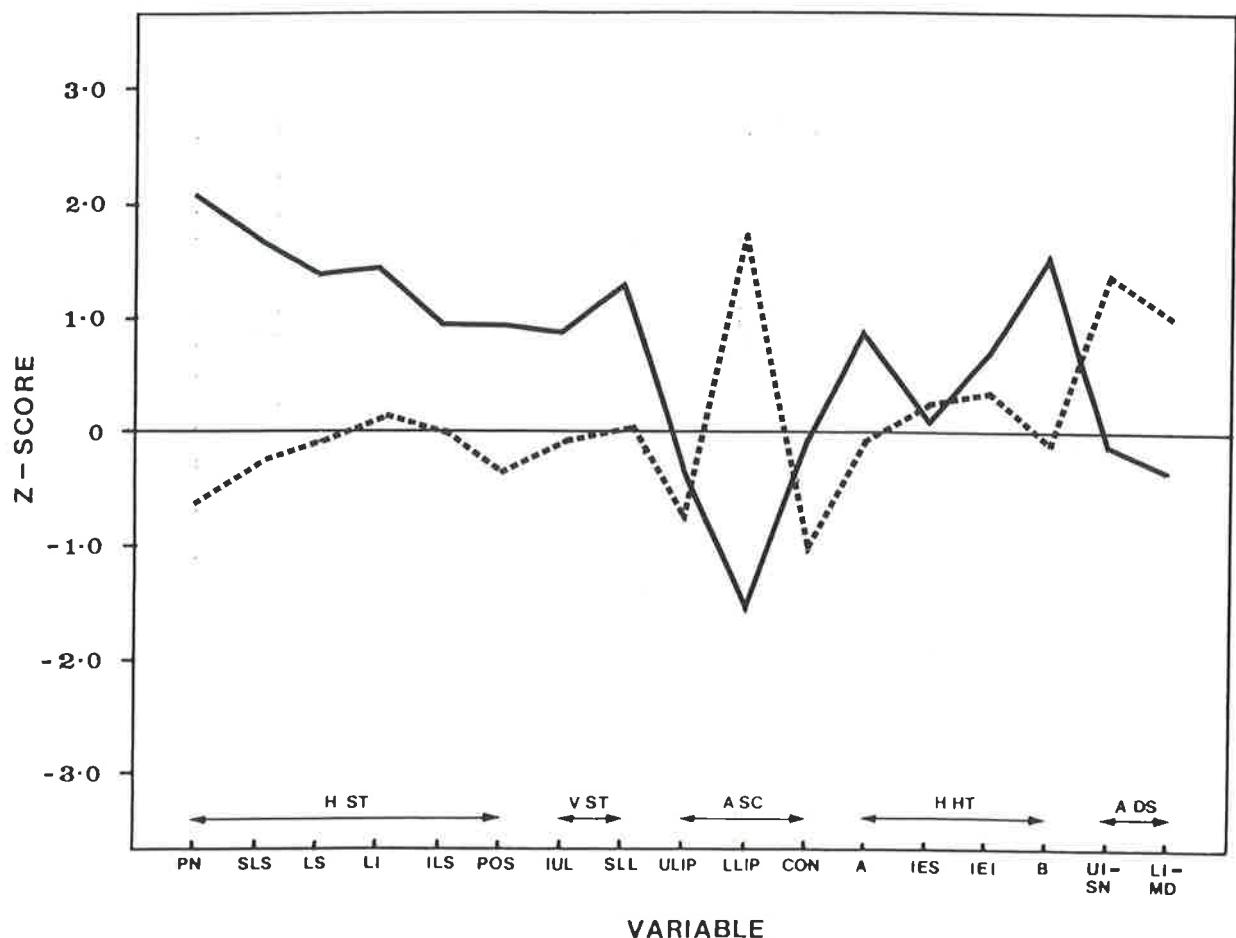

Figure e(iii) Graph of Z-scores for case 4

E. CASE 5

Subject 15, male
Class 1, bimaxillary prognathism

Age pre-treatment : 14.3 yrs. (0.5 standard deviations from \bar{x})

Age post-treatment : 16.8 yrs.

Difference between post- and pre-treatment ages 1.06 standard deviations from \bar{x}

The hand-wrist radiograph indicated that the skeletal age was approximately 12.5 yrs, which was more than 1.5 yrs. less than the chronological age pre-treatment (Greulich and Pyle, 1966). According to Grave and Brown (1976) (figure 13) this indicated that this subject was pre-peak in relation to the adolescent growth spurt.

- Treatment : Four first premolars extracted.
- Lip posture : Extreme interlabial gap before treatment.
Large interlabial gap after treatment.
Relaxed posture.
- Z-scores : Pre-treatment the scores for V ST IUL and V ST SLL confirmed the incompetent lip pattern (see also figure 2). During treatment the upper lip moved vertically 2 standard deviations more than average, while the lower lip showed less than average vertical change. The lower incisors retracted and proclined less than the \bar{x} .
- Discussion : Figure (i) shows that a significant amount of growth occurred. The upper lip showed little tendency to follow the upper incisor retraction. Both lips seemed to "thicken" with treatment.
