Department of Pharmacology,
Galveston, Texas.

Dear Dawson,

        Thanks for your letter. I am very glad indeed to know
what you are doing. The figures you send seem decidedly reassuring
on the <s>viability of normal cats</s>. I think the increase in variance
        normality of the lethal doe
of the lethal dose with increasing rate of injection is a sound
reason for preferring the logarithm. I forget whether or not you
know the series of papers published by C.I.Bliss over here in the
Annals of Applied Biology. I believe one more bearing on time of
survival is due to appear shortly. If you do not already know these
I think you will find them exceedingly useful as he illustrated a
variety of procedures in great detail.

        It so happens that quite a number of my little girls
have taken simultaneously to collect stamps, so there is great
enthusiasm and a large demand. Yoursuggestion is, therefore,
Very much a propos.

                Yours sincerely,
