

26th. February 1946.

My dear Henry,

I have been trying to reconstruct, from the letters you have sent me from time to time, the full data so far gathered on the frequency of the medionigra mutant in Dominula. I wonder now if you could let me have a copy of the completed frequencies for the six years for which you have evaluated them.

A few days ago I sent copies of some American letters received in connection with our recommendations on human gene notation. I think you will find them interesting. Evidently ~~Sturtevant~~ and Boyd are not willing to support Weiner's attitude, and the latter is

obviously very angry about it. I do feel he has only himself to blame, since he was treated with great consideration by Taylor and Race, which he has conspicuously failed to reciprocate.

Yours sincerely,
