

June 25, 1942

Dear Peters,

I am sending with this the book by Schumacher and Chapman that I mentioned. I like his definition on the first page:

"statistical methods, which is the process of extracting from one or more samples all the information they contain concerning the population they represent"

If that much were realized and understood in ~~most statistical~~ ^{mathematical} departments, they would not be surprised that a first class book on statistics should be published under the title "Sampling Methods in Forestry ^{etc} ~~and Range-Management~~"

Yours sincerely,

P.S. Let me have the book back when you are through.
