

31 March 1933.

Dr. J. Wishart, F.R.S.E.,
School of Agriculture,
CAMBRIDGE.

My dear Wishart:

I have looked through the first batch of tables and made a few notes on them. Please take these as merely for your consideration. On the one point which you put for decision I should favour the ordinary method of mean differences merely as being more familiar to the majority of users. I have, however, included one or two heterodox suggestions in respect of mean differences, which have ~~however~~, no great force except for a five-figure table presented in the four-figure form.

Let me know if anything that looks like much work seems worth constructing, so as to allow me to be of any possible assistance.

Yours sincerely,

Tables enclosed
