Declaration

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

The author acknowledges that copyright of published works contained within this thesis resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

Acknowledgements

I have been lucky enough to have undertaken my PhD with the supervision and guidance of Anne Taylor, Gary Wittert and Graeme Hugo. To Anne, thank you for setting my feet on this path, for your trust, your endless wisdom and for helping me to realise my goals. To Gary, thank you for all of your invaluable advice, for the time and effort you have dedicated to helping me improve my work and for encouraging me to set my sights high. To Graeme, thank you for your feedback, your continuing support and for the opportunities you have granted and entrusted me with for the NOBLE project.

I would also like to acknowledge and thank the NWAHS and FAMAS participants– without you the work we do would not be possible.

To my colleagues at Population Research and Outcome Studies, you have been my second family throughout this process and for all your advice, support and friendship I will be forever grateful. I would particularly like to acknowledge Eleonora Dal Grande and Constance Kourbelis for your help and encouragement over the past few years. To the many other people I have called on more than once who have kindly given their time, help and advice, I owe you a debt of gratitude. Thank you.

A big thank you to all my family and friends who have provided support in many ways you are most likely unaware of. Mum and Dad, I will always treasure and be thankful for how you encourage and support me in all of my choices. Kylie Ellis, a big thank you for being so generous with the advice and encouragement of one who has already travelled this road.

Lastly- to Michael, I will always appreciate your never-ending support during this time. Thanks for being patient when I hadn't the energy to be and for the countless things you have done.

Abstract

The increase in obesity prevalence seen in Australia since the 1970s and the rise in comorbid chronic conditions –particularly diabetes, pose a significant problem for society and government in terms of consequences for government spending on health, workforce participation, economic growth and quality of life.

Baby Boomers, born from 1946 to 1965 and Generation Xers born from 1966 to 1980 together form over half of Australia's total population and nearly 75% of the working population. Their continued health into older age is essential if the nation is to cope with the quadrupling of the 85 plus population by 2050¹.

This research explores generational differences in health status and the influence of work and workplace on health, irrespective of age. The aim of this is to highlight risk factors for the development of obesity and comorbid conditions, as well as specific groups that can be targeted by programs and policies to improve the health of Australia's population.

Using National Australian data, in Chapter 6 we explore the sociodemographic and health profile of Baby Boomers in 1989/90 and Generation X in 2007/08, in order to determine differences when the generations were of the same age of 25 to 44 years. This study illustrates that while Generation X are higher educated and have lower levels of smoking, they are also developing obesity and a higher prevalence of diabetes at an earlier age than their predecessors, and this may be reflected in their self-reported health status.

Chapter 7 explores generational differences in the association between job strain, occupation, psychological distress and the risk of overweight and obesity as defined by high waist circumference. Using data from two community based Adelaide cohort studies, this study provides evidence that for Generation Xers, work-related stress, occupation and psychological distress have significant relationships with unhealthy weight. The reasons for these generational differences require further exploration although it may reflect differing values, perceptions or lifecourse effects.

Chapter 8 examines the relationship between changes in employment status over time and the prevalence of Type 2 diabetes, depression, arthritis and obesity (BMI \geq 30) with and without comorbidities at follow up. Generation X is compared to early (born 1946 to 1955) and late (born 1966 to 1980) Baby Boomers using data from a biomedical cohort study based in the North West suburbs of Adelaide, South Australia. Remaining unemployed and becoming unemployed is associated with the presence of chronic conditions. No generational differences were demonstrated in adjusted analyses.

These studies have identified that the younger generation is developing obesity and diabetes earlier in the lifecourse, highlighted generational differences in the relationship between work related factors and obesity and demonstrated that workforce exit and unemployment is related to the presence of obesity and common comorbidities. These findings have significant implications for healthy ageing, workforce participation, healthcare utilisation and costs into the future.
