ZIRCON LU-HF CONSTRAINTS ON RECENTLY PROPOSED MODELS FOR THE TECTONIC ASSEMBLY OF PROTEROZOIC CENTRAL AUSTRALIA

U-PB AND ZIRCON LU-HF FROM CASEY INLIER

ABSTRACT

The Arunta region, central Australia, is interpreted to record evidence for the complex evolution and growth of the Australian continent during the Paleoproterozoic and Mesoproterozoic. The Warumpi Province, in the southern Arunta region, has been proposed to be an exotic terrain that has accreted to the more northerly Aileron Province in the North Australian Craton during the ca1640 Ma Liebig Orogeny.

The Casey Inlier has been identified to contain the boundary between the Aileron and Warumpi Provinces. U-Pb dating indicates ages of ca1652-1670 Ma granites to be the Warumpi Province and the ca1756-1774 Ma granitic to be the Aileron Province. New Lu-Hf zircon analysis undertaken in this study revealed that the source regions of both provinces are isotopically indistinguishable. U-Pb and Lu-Hf analysis of detrital zircon in a quartzite cover sequence provides a maximum depositional age of ca1311 Ma and an isotopic signature that is characteristic of the Musgrave Province. This suggests that the Arunta region was proximal at this time. Field observation indicate a pervasive NNW-SSE strike fabric with east side up shear dated at ca 1730 Ma age, with a later west side up shear fabric attributed to be ca 1140 Ma shear fabric. The data obtained in this study combined with previous evidence for shared histories indicate the Warumpi Province was not exotic to the Aileron Province and it is most unlikely that a suturing event occurred at ca 1640 Ma.

KEYWORDS

Aileron, Warumpi, Casey Inlier, Lu-Hf, U-Pb, Zircon

TABLE OF CONTENTS

List of Figures and Tables.....	3
Introduction.....	4
Geological Setting.....	6
Formation of the Arunta region.....	6
Geological setting and field observations of this study area.....	10
Eastern Domain.....	11
Central Domain.....	13
Western Domain.....	16
Sample description.....	18
Eastern Domain petrological and monazite sample.....	18
Central Domain metasediments.....	18
Central Domain granites.....	19
Central Domain petrological samples.....	20
Western Domain granites.....	20
Petrological description.....	21
Methods.....	24
U-Pb LA-ICP-MS geochronology.....	24
Lu-Hf LA-MC-ICP-MS zircon isotope analysis.....	26
Results.....	28
U-Pb zircon LA-ICP-MS geochronology.....	28
Central domain metasediments.....	28
Central Domain granites.....	29
Western Domain granites.....	30
Monazite analysis.....	35
Zircon Lu-Hf results.....	36
Discussion.....	40
Interpretation of U-Pb zircon age from basement metasedimentary units.....	40
U-Pb zircon ages from granitic rocks.....	41
Interpretation of Monazite data.....	42
Interpretation of Lu-Hf isotopic data.....	43
Tectonic events that have affect the Casey Inlier.....	44
Suture model.....	46
Conclusions.....	47
Acknowledgments.....	47
References.....	49
Appendices.....	51
Appendix a).....	51
Appendix b).....	51
Appendix c).....	51

LIST OF FIGURES AND TABLES

Figure 1: Proposed suturing between the North Australian Craton and the merger of the South Australian Craton the 1800-1500 Ma, followed by the merger of the further addition of the SAC to create the Musgrave Province during 1300-1100 Ma.....	4
Figure 2: Location of the Arunta Region, Warumpi Province and Casey Inlier.....	7
Figure 3: Simplified geology of the Casey Inlier indicating and the location of samples used in this study are marked.....	11
Figure 4: Field image.....	12
