ABSTRACT

Southern India is comprised of granulite facies metamorphosed crustal blocks, separated by crust penetrating shear zones that have experienced a diverse tectonothermal history from the Archaean to Cambrian. The early Palaeoproterozoic metamorphosed Salem Block in southern India preserves felsic and mafic gneisses ideal for investigating the aerial extent of the preserved Archaean-Palaeoproterozoic southern Indian crust and the metamorphic rock record in the Archaean-Palaeoproterozoic transition. U-Pb zircon, *in situ* monazite geochronology and zircon REE analysis obtained using Laser-Ablation Inductively-Coupled-Plasma Mass-Spectrometry (LA-ICP-MS), and *P-T* phase equilibria and average *P-T* conventional thermobarometry calculated using THERMOCALC from the Kanja Malai Hills, demonstrate that the Salem Block extends south to at least the northern Palghat-Cauvery Shear System. Peak *P-T* estimates of ~800-850 °C and 14-16 kbar at *ca.* 2490 Ma were attained in the southern Salem Block and suggest decompression followed peak metamorphism. The *P-T-t* constraints in the southern Salem Block are anomalously high pressure compared to other Archaean-Palaeoproterozoic metamorphic events and require thermal regimes that are typically generated in convergent plate margin settings.

Keywords: Southern Granulite Terrane, Salem Block, metamorphism, LA-ICP-MS, U-Pb geochronology, Palaeoproterozoic.

TABLE OF CONTENTS

1. INTRODUCTION	5
2. GEOLOGICAL BACKGROUND	7
2.1 Regional geological overview of Southern India	7
2.2 The Salem Block.....	9
2.3 The Kanja Malai Hills	11
3. FIELD AREA AND LITHOLOGICAL RELATIONSHIPS	12
4. MINERAL PETROLOGY	14
4.1 Kyanite and garnet bearing felsic gneisses	14
4.1.1 Sample JA3 and JA7	14
4.2 Garnet bearing mafic gneisses	15
Garnet bearing mafic gneisses (Fig. 3.a) were taken from a prominent ridge in the north of the Kanja Malai Hills mapped area.....	15
4.2.1 Sample JA9a.....	15
4.2.2 Sample EM16 and JA10.....	16
4.2.3 Sample EM19	17
4.3 Felsic gneisses	17
4.3.1 Sample JA13 and JA14	17
5. MINERAL CHEMISTRY	19
5.1 Garnet bearing mafic gneiss samples.....	19
5.1.1 Garnet	19
5.1.2 Feldspar	20
5.1.3 Clinopyroxene	20
5.1.4 Amphibole	21
5.1.5 Ilmenite	22
5.1.6 Magnetite.....	22
5.2 Kyanite-garnet bearing felsic gneiss samples	23
5.2.1 Garnet	23
5.2.2 Feldspar	23
5.2.3 Biotite	24
6. OUTLINE OF ANALYTICAL TECHNIQUES.....	25
6.1 Quantified metamorphic analysis- <i>P-T</i> pseudosections and conventional thermobarometry	25
6.2 Zircon and monazite geochronology and zircon trace and REE chemistry	26
7. RESULTS	27
7.1 <i>P-T</i> pseudosections	27
7.2 Conventional thermobarometry	28
7.3 Zircon and monazite LA-ICP-MS age data	29

7.3.1 JA3	29
7.3.2 JA13	30
7.3.3 JA14	31
7.3.4 JA7	31
7.4 Zircon chemistry	32
7.4.1 Zircon U-Th-Pb chemistry	32
7.4.2 Zircon REE chemistry	34
8. DISCUSSION.....	36
8.1 Interpretation of zircon and monazite ages.....	36
8.1.1 Zircon ages and chemistry	36
8.1.2 Monazite ages.....	41
8.1.3 Age of metamorphism.....	42
8.2 Conditions of metamorphism	43
8.3 A polymetamorphic terrane?	46
8.4 Refinement of the conditions of the early Palaeoproterozoic high grade metamorphic event in the Salem Block.....	47
8.5 Tectonic implications for the Southern Granulite Terrane	49
8.6 Comparisons of high <i>P</i> metamorphism in the early Palaeoproterozoic	51
9. CONCLUSIONS.....	53
ACKNOWLEDGEMENTS	54
9 REFERENCES	55
10. FIGURE AND TABLE CAPTIONS.....	61
11. APPENDIX I- MONAZITE AND ZIRCON CHARACTERISTICS.....	67
11.1 Monazite characteristics.....	67
Sample JA7	67
11.2 Zircon characteristics	67
Sample JA3	67
Sample JA14	68
Sample JA13	69
12. APPENDIX II- ANALYTICAL PROCEDURES.....	70
12.1 Quantified metamorphic analysis- <i>P-T</i> phase diagrams	70
12.2 Quantified metamorphic analysis- Thermobarometry	71
12.3 LA-ICP-MS U-Th-Pb zircon and U-Pb monazite Geochronology.....	73
12.4 Zircon REE chemistry	75
13 FIGURES.....	77
14 TABLES.....	94
